

## **Assistive Listening Device: Personal Listening Device**

An assistive listening device decreases the effects of background noise and will allow the student increased access to the spoken message.

### **General Information**

- The student is using a personal listening device, which includes a microphone and coordinates with the student's hearing technology. The microphone will be transmitted directly to the student's technology and will not be amplified to others. The student will give the microphone to the professor at the beginning of each class.
- Typically, the student will use their own personal listening device and will provide the microphone and instructions to each professor.
- If this accommodation is approved, and the student does not have their own personal device, further options will be discussed to obtain equipment which integrates with their personal hearing technology.

### **Student Responsibilities**

- The student will be responsible for care and use of the personal listening device. The microphone will need to be handed to the professor at the beginning of each class. Give your professor feedback if the volume is too low or the microphone placement is incorrect.
